Developmental genetics of the COPD lung

Genetic and environmental factors contributing to COPD are presently under investigation As lung function measures cluster within families, we now know that lung function is partly inherited Thus, identifying genes involved in determining lung function at the population level and in determining the risk of development of COPD is important

Lung Growth And Development Lung Biology In Health And ...

lung development begins within 2 3 weeks of conception and is completed when thoracic growth ceases in late adolescence human lung morphogenesis largely occurs before birth and during infancy under the control of a genetic program that is modulated by endocrine and physical factors interval between the previous and current editions of this

Prenatal and postnatal genetic influence on lung function ...

genes affect lung function development from birth to childhood Objective: Our aim was to study the association of candidate genetic variants with neonatal lung function and lung function development until age 7 years Methods: Lung function measurement by means of spirometry with the

Transcriptional Control in the Developing Lung

dular phase of lung development In the adult lung, SP-B is expressed in nonciliated bronchiolar and alveolar type II cells Analysis of the transcriptional control of the SP-B gene was facilitated by the use of human pulmonary adenocarcinoma cells (1-1441 cells) 1-1441 cells express SP-B and are readily transfectable with SP-B gene constructs

E3 ubiquitin ligase RFWD2 controls lung branching through ...

The mammalian lung is an elaborate branching organ, and it forms following a highly stereotypical morphogenesis program It is well established that precise control at the transcript level is a key genetic underpinning of lung branching In comparison, little is known about how regulation at the protein level may play a role Ring finger and

REVIEW: DEVELOPMENT Genetic Control of Branching ...

REVIEW: DEVELOPMENT Genetic Control of Branching Morphogenesis Ross J Metzger and Mark A Krasnow* The genetic programs that direct formation of the treelike branching structures of two animal organs have begun to be elucidated In both the developing Drosophila tracheal (respiratory) system and mammalian lung, a fibroblast growth factor (FGF)

The molecular genetics of human lung cancer

ABSTRACT: With the development of molecular biological techniques the search for genetic alterations in cancer cells has resulted In the beginning of a molecular description of cellular transformation Most of these genetic changes occur in genes which have a role in the control of cellular growth and development, the proto oncogenes

Tobacco, Genetic Susceptibility and Lung cancer

Genetic susceptibility and lung cancer Tobacco Use Insights 2010:3 (for eg smoking and radon exposure), the genetic constitution of an individual also has an important role in lung cancer predisposition or protection from it9-11 A possible role for genetic susceptibility in the development of lung cancer has been inferred from

Genetic Control of Experimental Murine Hypersensitivity ...

some aspect of the genetic control of PDE-in<uced pulmonary inflammation appears to be at the level of the development of immunologic reactivity to this antigen Overall, these studies show that the development of pulmonary inflammation by an etiologic agent of human lung disease is under genetic control; the response is multigenic;
